■ TPC-200W

Our new compact light weight design adds enormous versatility for those hard to reach places. Weighing in at only 12KG makes The TPC 200w a great choice for light residential or commercial use.

Only requiring standard 120v 15amp power this powerful little machine is a perfect fit for small shop or service truck. Cleanliness's matters, and with this technology a simple vacuum system can help keep you and the work site free of dust and fumes.

■ TPC-1000W

The TPC 1000w is our newly designed heavy duty industrial machine. Liquid cooling provides a 100% duty cycle, and can deliver you amazing performance for those time critical and environmentally crucial requirements (such as dams, bridges, etc.).

The 130KG lightweight design and 49ft (15-meter) fiber optic cable, combine mobility and superior operational coverage. The voltage requirement for 1000W is 220v/240v at 26amps.

■ TPC-300W

Our new TPC 300 design offers a liquid cooled laser system keeping all the critical components cool and allowing for a 100% duty cycle to keep you going on those time sensitive jobs.

Light weight Design 84KG and long Fibre cord (30ft, 10-meter) allows the machine to stay safely out of the way on those bigger jobs. The TPC 300 requires 220v/240v at 23amps.

Cleaning samples

As an advanced surface treatment technology, pulse laser cleaning machine has significant environmental advantages, which are mainly reflected in the following aspects:

- **No chemical agents, reducing pollution**

No need to use chemical reagents such as acids, alkalis, organic solvents, etc., avoid harmful waste liquid/waste gas emissions, and no secondary pollution.

- **No consumables, reducing waste**

Replace sandblasting abrasives to reduce solid waste; waste is recyclable powder, reducing processing costs.

- **Low carbon energy saving**

Precise cleaning reduces energy consumption, and combined with Canadian clean electricity (such as hydropower), it helps Canada plan to achieve net zero emissions by 2050.

- **Safety and health advantages**

No toxic dust/noise, avoiding occupational health risks (such as silicosis).

- **Comply with environmental regulations**

Chemical restrictions: No controlled chemicals such as VOCs are required, fully complying with Canadian "CEPA" and "CMP" requirements.

Low cost of waste: Solid powder waste is small in volume and recyclable, avoiding high provincial waste disposal fees.

Carbon emission target: Energy consumption is lower than traditional processes, and if combined with clean electricity, the carbon footprint is even lower.
